KUZGUNCUK VILLA PROJECT

Residential Architecture – Istanbul, 2023

Project Description

Located on a steep plot in Kuzguncuk, Istanbul, this residential project is designed to align with both the natural topography and the panoramic views of the Bosphorus. The building is structured across three levels, each carefully integrated into the slope to create direct access to outdoor spaces and maintain spatial continuity.

The project emphasizes functional family living, featuring large openings, multi-level terraces, and internal circulation that connects all floors vertically while preserving privacy. Materials are selected to reflect the neighborhood's calm texture while maintaining a contemporary form.

The design also prioritizes passive lighting and natural ventilation, enhancing indoor comfort while blending into the site's organic flow.
